

The iUP-Fast 27/K Personality Module

The iUP-Fast 27/K personality module lets the user program, read, and verify the contents of Intel's newest 64K and 256K EPROMs. This personality module supports the intelligent Programming algorithms and the intelligent Identifier. The intelligent Identifier lets the personality module interrogate the PROM device in the program/master socket. It determines whether the type selected matches the type of PROM device installed and then selects the proper intelligent Programming algorithm. The intelligent Programming algorithms reduce programming time up to a factor of 10.
